

## Simultaneous NCS Analysis

### Introduction

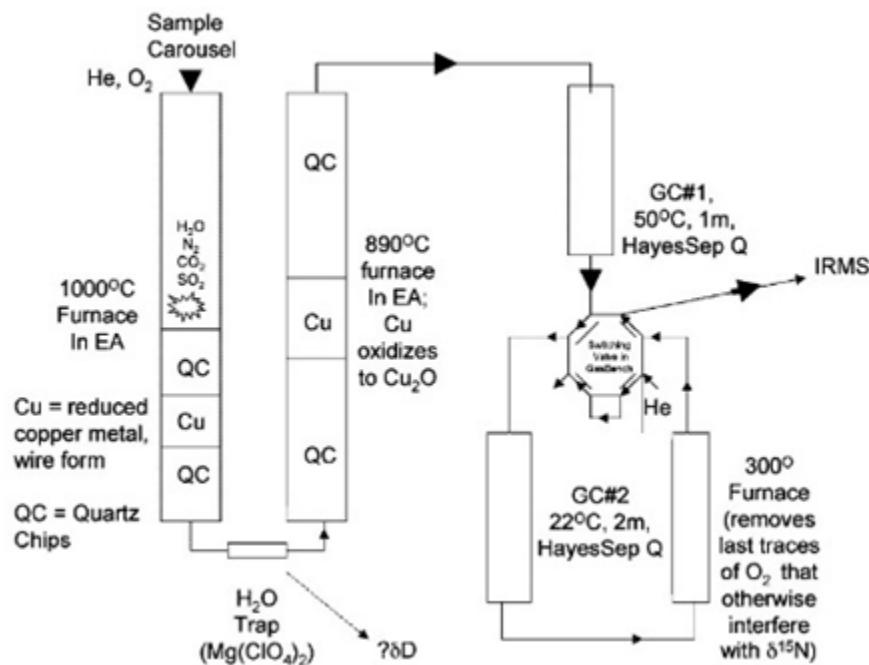

The need for a system capable of producing isotopic data of multiple elements from a single sample is of special interest in environmental applications, samples can be unique, expensive to obtain and difficult to replicate. Elemental analyser isotope ratio mass spectrometry is a destructive sampling technique and as such it can be important to maximise information obtained.

Sercon have successfully adapted their SL and GSL elemental analysers and 20-22 isotope ratio mass spectrometer to produce a system with the ability to perform this analysis.

Based upon the paper by Fry (2007), the system was modified to incorporate all the features described, namely altered combustion reagents, a second GC column with a valco valve to permit flow switching as per the diagram on the below.

The data table below shows an analytical run of ammonium sulphate and beet sugar and demonstrates the high precision obtained by this method, typically around 0.1‰ for all isotope species.

SerCon 'Callisto CF-IRMS' system

The system was tested using a combination of compounds, both inorganic and organic materials were used with a range of elemental composition and of sample matrix.
